PorterPacker (Linktri build)

A Windower 4 addon that automates storing and retrieving gear with the Porter Moogle using Storage Slips. This build merges Gimlic's continuous-mode fork (v0.0.1.02) onto Ivaar's base (v0.0.0.8) with Linktri's debug instrumentation, keypress-based store confirmation, keybinds, and timing/behavior fixes.

Current version: 0.0.1.09

Lineage

- **Base:** Ivaar's PorterPacker v0.0.0.8
- **Merged in:** Gimlic's fork v0.0.1.02 — continuous ("all") mode
- **Linktri modifications:** debug system, Odyssey Lobby support (zones 279/298), 0x0D keypress store confirmation, continuous-mode retiming, keybinds, `STOW_RETRIEVED` setting, run guard and trade watchdog, `pack everything`, and multiple bug fixes (see Changelog)

All non-obvious changes are tagged inline with `LINKTRI MODIFICATION` comments.

Installation

1. Copy `PorterPacker.lua` into `Windower4/addons/porterpacker/`.
2. Load with `//lua load porterpacker` or add `lua load porterpacker` to your `init.txt` / `NEXTGames` load block.
3. Create job data files in `Windower4/addons/porterpacker/data/` (see Data Files).

Commands

Aliases: `//porterpacker`, `//packer`, `//po`

Command	Aliases	Description
`pack [file] [all]`	`store`, `p`	Store inventory items with the Porter Moogle. With a file, only items in the file are stored.
`unpack [file] [all]`	`retrieve`, `u`	Retrieve items listed in the file. File defaults to `Name_JOB.lua`, then `JOB.lua`.
`repack [file] [all]`	`swap`, `r`	Store inventory items *not* in the file, then retrieve items that *are*. The "swap to this job's kit" command.
`pack everything`	`p ev`	Continuous store of **every** storable item from inventory, Wardrobes, and Satchel/Sack/Case. No data file needed.
`export [file] [all]`	`exp`	Export storable items to a data file (one line per item). With `all`, scans every accessible bag instead of just inventory.
`reset`		Clear a stuck "busy" state and stop a running continuous pass.

Command	Aliases	Description
`debug` / `debugon` / `debugoff`		Debug info dump / enable / disable debug logging.
`help`		Command summary.

Continuous ("all") mode

Appending `all` (or `a` / `continuous`) to pack/unpack/repack enables continuous mode:

- Storage Slips are pulled from **Satchel, Sack, and Case** as needed, traded, and returned to the bag they came from — slips do not need to start in inventory.
- Every run ends by sending every slip in inventory home: back to the bag it started in, or to `SLIP_HOME_BAG` (Satchel) if it was already in inventory. Any slip that can't be put back (bag full) is named in chat.
- With a job file, only items in that file are stored, on every pass.
- Storable items are pulled from **Wardrobes 1–8** through inventory automatically.
- Runs slip-by-slip until nothing matching remains. A pass that makes no progress ends the run (with an 80-pass safety valve behind that).
- Anything still stored at the end is listed by name, so a slip sitting in the Mog Safe or a full inventory never fails silently.
- If 3+ storable items are found with no matching slip owned, a "Consider getting Storage Slip N" advisory is printed. If you own the slip but it's in a bag the addon can't reach, it says that instead.
- Only one run at a time: a second command or keybind press while a run is going is refused with a "busy" message.
- If a trade gets no response, you zone, or you use `//po reset`, the run stops, reports "Stopped early", and still puts any slips it pulled back where they came from.
- Unpack and repack finish by running DressUp's `//du lockstyle` to apply the job's lockstyle set (clean finishes only for `all` runs).

Plain `pack` / `unpack` / `repack` (without `all`) don't move slips at all: the slips must already be in inventory, and they stay there afterwards.

Not scanned: Mog Safe, Storage, and Locker. The game client cannot move items out of those bags outside your Mog House, so slips or gear living there are unreachable at a field Porter Moogle.

Keybinds

Registered on addon load, released on unload. Edit the `KEYBINDS` table at the top of the file to change them.

Key	Command
`Ctrl+Alt+P`	`po pack all`
`Ctrl+Alt+U`	`po unpack all`
`Ctrl+Alt+R`	`po repack all`

All three use the default job data file and will abort with an error if none exists for the current job. You must be within ~6 yalms of a Porter Moogle.

Settings

At the top of `PorterPacker.lua`:

- **`DEBUG_MODE`** (default `false`) — verbose logging of the packet state machine, zone/menu discovery, and continuous-mode progress. Toggle live with `//po debugon` / `//po debugoff`.
- **`STOW_RETRIEVED`** (default `false`) — when `false`, retrieved gear stays in inventory; unpacking stops with a warning if inventory fills (free space and run it again to continue). When `true`, retrieved gear is stowed into Wardrobes in `bag_priority` order (7 → 6 → 5 → 4 → 3 → 2 → 1 → 8), Gimlic's original behavior.
- **`KEYBINDS`** — key-to-command map, see above.
- **`TRADE_TIMEOUT`** (default `5`) — seconds to wait for the Porter's menu after a trade before resetting.
- **`TRADE_STALL_TIMEOUT`** (default `15`) — continuous mode stops if a trade cycle makes no progress for this long (long enough to confirm a prompt by hand).
- **`bag_priority`** — Wardrobe stow order used when `STOW_RETRIEVED` is `true`.
- **`SLIP_HOME_BAG`** (default `5`, Satchel) — where continuous mode puts slips that were already in inventory when the run started. `6` = Sack, `7` = Case, `nil` leaves them in inventory. Slips that started in Satchel/Sack/Case always go back to that bag.
- **`LOCKSTYLE_AFTER_UNPACK`** (default `true`) — run `//du lockstyle` after an unpack or repack. Needs the modified DressUp.

Data files

Data files live in `Windower4/addons/porterpacker/data/` and return a Lua table of item names:

```
return {
    "Wicce Coat +3",
    "Agwu's Robe",
}
```

Lookup order is `Name_JOB.lua` (e.g. `Linktri_BLM.lua`) then `JOB.lua`. Generate a starting file with `//po export` (inventory only) or `//po export all` (all bags).

Design notes

- **Store confirmation** uses confirmation-byte detection at offset 0x0D plus a simulated Enter keypress. If your chat line is open, it waits up to 5s for it to close rather than sending Enter into chat; otherwise confirm the prompt yourself. Unlike packet-rewrite approaches, this preserves the game's original messages (correct item names and counts) and drives the state machine with a genuine menu-selection packet.
- All continuous-mode delays are gated on work actually happening; the only fixed pacing is a 2s settle after items are pulled from other bags into inventory.

Rolling back

Version 0.0.1.06 is preserved on the `v0.0.1.06-backup` branch. Download `PorterPacker.lua` from there to roll back. Later versions can be restored from the commit history.

Changelog

- **0.0.1.09** — Slips reliably go back to Satchel/Sack/Case. Returns used to check inventory once, right after a trade, while the slip could still be locked by the Porter's menu or in transit, and then silently do nothing; a slip that landed late during unpack was neither traded nor returned; and nothing cleaned up after a normal finish. Now each return waits for the slip to settle and confirms the move, every run ends with a sweep of all slips in inventory (`SLIP_HOME_BAG` for slips that started in inventory), and any slip that can't be put back is named. Also fixed: `pack all` with a job file lost the file filter after its first trade and could store gear that isn't in the file.
- **0.0.1.08** — After an unpack/repack finishes, runs DressUp's `//du lockstyle` to apply the job's lockstyle set (`LOCKSTYLE_AFTER_UNPACK`).
- **0.0.1.07** — Code-review fixes. Re-entrancy guard (a double keybind press could start two parallel runs). Trade watchdog plus zone-change reset (a trade with no menu response left the addon stuck at "busy state: 1" until reload); new `reset` command. Every continuous-mode exit now clears `original_retrieve` (a stale list made the next normal `pack` skip items) and reports "Stopped early" instead of "Completed Movements"; aborted runs still return slips to their bags. Data file lookup now really tries `Name_JOB.lua` before `JOB.lua`. Continuous mode rescans after every trade, stops when a pass makes no progress, won't pull a slip into the last open inventory slot, and lists anything left in storage. Slip-return logic consolidated; `retrieve_items` no longer sends duplicate moves. Store auto-confirm no longer presses Enter into an open chat line. `export` dedupes. Added `pack everything`. `last_update` made local; dead code removed. Fixed four misspelled names in the DRG/RDM/SCH/WHM data files, and renamed `gitignore` to `.gitignore`.
- **0.0.1.06** — Added `STOW_RETRIEVED` setting (default off): retrieved gear stays in inventory; clean stop with warning when inventory fills mid-retrieve.
- **0.0.1.05** — Added addon-managed keybinds (Ctrl+Alt+P/U/R), bound on load and released on unload; help text updated.
- **0.0.1.04** — Retimed continuous mode: all sleeps gated on actual work; `put_away_items` exits immediately when idle instead of retrying 4×1s (pack runs previously wasted ~6–10s of sleeps per slip).
- **0.0.1.03** — Merged Gimlic's continuous mode onto the Linktri/Ivaar base. Kept the 0x0D keypress store confirmation; did not port the 0x0C packet rewrite. Fixed in the ported code: `original_retrieve` local-shadowing bug (the don't-restore filter was permanently inert), global `i` leak in the retrieve loop, file-level `slip_used` moved into its loop, nil guard before slip `retrieve_items` call.
- **Earlier (Linktri base)** — Debug system, Odyssey Lobby zone support ([279]/[298] = 13), keypress-based auto-confirmation for stores.
